

Acknowledgment

I would like to first thank **Professor Lingpeng Kong** and **Dr. Xiachong Feng**, who were probably the earliest people to make me think that doing a PhD might be a sensible decision rather than an unusually long episode of academic self-destruction. They taught me not only how to do research, but how to do good research: to care about curiosity, rigor, and meaning instead of just noise and speed.

I am also deeply grateful to **Dr. Lijun Wu**, from whom I learned a great deal during my time at Shanghai AI Lab. He taught me many important things, especially that meaningful research is worth doing slowly and properly, and that developing research taste takes time, patience, and a willingness to not be impressed by everything shiny.

I would also like to thank my parents for always supporting me with remarkable openness and patience. They gave me the freedom to explore what I genuinely enjoy, never pressured me into a more “practical” path, and were surprisingly tolerant of all my decisions. I would not be here without their trust and support.

It would also be dishonest not to thank League of Legends (Grandmaster 874 LP), Apex Legends (Diamond I), Delta Force (400 million asset, by far the most successful investment portfolio I have ever managed), and several other games for contributing greatly to my university life, both emotionally and statistically. Special thanks to my five teammates who played the Hong Kong University League of Legends Tournament with me for four consecutive years.

I am also grateful to Cursor, ChatGPT, Gemini, Doubao, Qwen, and Claude for making studying, coding, debugging, and last-minute survival much easier. At some point, they stopped feeling like tools and started feeling like suspiciously reliable companions. I would also like to thank Overleaf, GitHub, and Hugging Face for keeping both my work and, at critical moments, my consciousness alive.

Finally, I would like to acknowledge the countless bugs, failed experiments, broken environments, strange error messages, and deadlines that arrived much faster than basic physics should allow. They were not always enjoyable, but they did contribute significantly to my technical skills, emotional stability, and ability to remain calm while everything was very clearly not calm.
